

Michael Furlan

Game 10033-2D interactive task

Thought process:

Honestly, it kind of just came to me; but I can talk about how I slowly worked my way to the final project! My original idea still had the sun going behind the hill. It still had the background going from dark to light depending on the Y level of the sun. Where it differs is when you press the spacebar. Currently it changes the sun into the moon; where in the concept idea it was a solar eclipse. This would have turned the sun into a bright red, and the sky to a pinky/rose color. I quickly found out when coding I had no idea how to do that. So, I kept it simple and changed it to the moon. When working on my project, I also wanted to affect the color of the hill and sun depending on the position of the sun/moon. I quickly found out it looked super nice but felt a lot less clear. So, I kept it way more basic and clean with the same design goal!

(scroll down for my drawings for the task, word is weird with photos/ there are 2)

- Front hill green static
- sun follows mouse
- sun gets hidden behind hill
- Background changes color based on position
- top is light
- bottom is dark
- Day to night
